

MASS-APP-014-V17 — Application Integration, Responsibility Closure & Production Readiness

Document Control

Field | Value

Document ID | MASS-APP-014-V17

Version | 1.0

Status | Production Baseline v1.0 — Application Closure Candidate

Authority | EWO-MASS-APP-014-V17

Date | 2026-08-03

1. Purpose

V17 reconciles APP-014 responsibilities, contracts, events, gateways, roles, migrations, findings, limitations, and downstream constraints. It creates a reviewable closure package without inventing new intelligence domains or declaring the application frozen.

2. Permanent Architecture

V17 owns closure runs, evidence snapshots, finding dispositions, readiness assessments, handoff packages, and freeze recommendations. It does not own the capabilities documented by V01–V16 and cannot revise accepted history. Closure records are append-only and point to canonical source artifacts.

3. Role Mapping

Role | Baseline Mapping | Authority

Closure Viewer | Viewer specialization | Inspect closure evidence and registers

Closure Contributor | Contributor specialization | Record evidence and proposed dispositions

Closure Steward | Steward specialization | Validate inventories and readiness checks

Finding Owner | Contributor extension | Own a localized correction or accepted debt item

Closure Approver | Administrator specialization | Approve closure disposition for submission

Executive Authority | External constitutional authority | Sole authority to freeze APP-014

V17 does not approve its own readiness recommendation.

4. Platform Consumption Map

V17 consumes the Constitution, ENG-001–027, MASS-PLAN-001, APP-013 frozen baseline, APP-014 canonical artifacts, production manifests, revision logs, work orders, completion reports, IRO/LCO records, and manufacturing standards. It produces only closure evidence, inventories, readiness findings, transition constraints, and a freeze recommendation.

5. Gateway Inventory

Gateway | Purpose

ConstitutionGateway | Verify constitutional references and authority boundaries

EngineeringLibraryGateway | Verify ENG dependencies and ownership

ProductRoadmapGateway | Read MASS-PLAN-001 identifiers and sequence

DesignStudioGateway | Verify APP-013 consumption boundary

App014ArtifactGateway | Inventory V01–V16 artifacts and contracts

ProductionGovernanceGateway | Read work orders, reports, manifests, IROs, and LCOs

RepositoryGateway | Resolve canonical paths and commit evidence

AuditGateway | Preserve closure audit evidence

These are read-oriented closure adapters. V17 does not mutate source publications.

6. Responsibility Inventory

Canonical evidence confirms V01–V04 and V08–V16. No canonical APP-014 V05, V06, or V07 artifact or manifest entry was found. V17 does not infer their titles or responsibilities. They remain identifier gaps requiring roadmap authority before freeze.

The capability traceability matrix maps every evidenced volume to its permanent responsibility. Existing responsibilities remain distinct: foundation, organizational memory, decision intelligence, agent/plugin orchestration, communication intelligence, execution intelligence, discovery, executive awareness, execution assurance, organizational learning, governance advisory, context synthesis, and evaluation governance.

7. Cross-Volume Consistency

Ownership

APP-014 consumes APP-013 artifacts without owning projects, components, templates, publications, assets, content, or visualizations. ENG-009 remains exclusive AI orchestration authority. ENG-007, ENG-008, ENG-011, ENG-024, and ENG-027 retain knowledge, persistence, observability, analytics, and lineage ownership.

Human Authority

All volumes preserve advisory intelligence. No documented APP-014 interface grants autonomous approval, policy change, source mutation, deployment authorization, or operational execution.

Tenant Isolation and Persistence

V13–V17 use the current standards: UUID defaults, tenant uniqueness, composite tenant-safe foreign keys, auth.jwt() RLS, gateway inventories, and database-enforced immutable decisions. Earlier volumes remain subject to approved LCO correction paths; closure does not conceal that debt.

8. API, Event, and Gateway Review

Namespaces are capability-specific and no confirmed endpoint collision was identified among the inventoried volumes. Event names are domain-prefixed. Gateways preserve source ownership. The authoritative registers accompanying this volume record each closure-relevant contract and dependency.

9. Migration Strategy

Migration ordering follows volume dependency: V01 → V02 → V03 → V04 → V08 → V09 → V10 → V11 → V12 → V13 → V14 → V15 → V16 → V17. V05–V07 cannot be inserted or skipped as a freeze assumption without roadmap disposition. Each applied migration requires transactionality, tenant-isolation validation, rollback planning, and schema-history preservation.

10. Findings and Debt

Finding | Classification | Disposition

V05–V07 absent from canonical artifacts and manifest | Unresolved identifier gap | Executive/roadmap determination required before freeze

LCO-004 for V08/V09 | Approved localized correction | Scheduled correction pass

LCO-005 for V10 | Approved localized correction | Scheduled correction pass

V10–V13 implementation review | Review evidence pending/ongoing | Incorporate authorized IRO findings through LCO

V14–V17 implementation review | Pending | Submit current closure package

No item is silently represented as resolved.

11. Closure Questions

1. Does every permanent responsibility have a documented home? Every evidenced responsibility does; V05–V07 prevent a claim of complete identifier coverage.
2. Are ownership and authority boundaries consistent? Yes across inventoried volumes, subject to implementation review.
3. Can migrations coexist tenant-safely? The current standard supports coexistence; earlier approved corrections must be applied and validated.
4. Are external dependencies represented by gateways? Current volumes comply; earlier folder-structure gaps are tracked by LCO.
5. Are review findings governed? Yes: resolved, accepted debt, pending review, or assigned LCO.
6. Is APP-014 ready to freeze? Not yet. It is a closure candidate pending LCO/ IRO disposition, V05–V07 roadmap determination, and Executive Authority.
7. What must APP-015 consume? Stable APP-014 advisory contracts, tenant context, governed plugin-extension points, event contracts, source-of-truth boundaries, and human approval constraints; APP-015 must not duplicate APP-014 intelligence ownership.

12. V1 Implementation

V17 implements closure-run records, immutable evidence references, finding dispositions, readiness checks, transition constraints, and a human-approved freeze recommendation. It does not create runtime intelligence features.

13. Future Controlled Revision

After Executive freeze, changes require a versioned correction or successor baseline, explicit authority, updated traceability, migration impact, and preserved history. Freeze does not mean immutability of knowledge; it means controlled evolution.

14. Constitutional Boundary Statement

V17 may inspect, reconcile, validate, classify, and recommend closure. It cannot rewrite accepted artifacts, hide debt, manufacture missing volumes, expand APP-015 ownership, certify Gold Master, or freeze APP-014 without Executive Authority.

Implementation-grade closure persistence is defined in MASS-APP-014-V17_Migration_Reference.sql.
