

MASS-APP-014A

AI Creative & Knowledge Intelligence Foundation

Executive Engineering Brief

Version 1.0

Purpose of this Volume

Artificial Intelligence within MASS HQ is an enterprise collaborator rather than an autonomous replacement for human judgment. This volume establishes the constitutional philosophy, engineering principles, and operational boundaries governing AI throughout the MASS ecosystem. Version 1 defines the architectural foundation upon which future AI capabilities shall be built.

Engineering Philosophy

AI should improve understanding before increasing automation. Its purpose is to strengthen comprehension, creativity, communication, learning, planning, decision-making, and enterprise memory while preserving human accountability. Human judgment remains the final constitutional authority.

Construction Objectives

Version 1 establishes enterprise AI philosophy, human-AI collaboration, multi-provider architecture, enterprise context utilization, institutional memory integration, recommendation services, creative assistance, knowledge assistance, explanation services, human approval boundaries, constitutional ownership preservation, AI accountability, and long-term extensibility.

Constitutional Authority

Artificial Intelligence derives its authority from the MASS HQ Constitution and the Engineering Library. AI consumes governed enterprise services, does not own enterprise truth, and must never redefine enterprise reality.

Relationship to MASS HQ

AI serves every constitutional department and application, including Executive Intelligence, Relationship Command, Customer Experience, Growth, Operations, Dispatch, Finance, Communications, Knowledge, Documents, Design Studio, Analytics, and Planning. AI amplifies enterprise capability while preserving constitutional ownership.

Core Engineering Principles

AI shall remain explainable, attributable, auditable, configurable, provider-independent, constitutionally governed, and focused on enhancing rather than replacing human expertise.

Claude Engineering Guidance

Engineer AI as a governed enterprise collaborator. Reuse existing enterprise services before introducing independent logic. Preserve explainability, configurable approvals, provider abstraction, enterprise trust, and long-term maintainability.

Definition of Success

Upon completion of Version 1, MASS HQ shall possess a unified AI architecture capable of assisting every enterprise application while preserving governance, transparency, security, constitutional ownership, accountability, and extensibility.

Engineering Blueprint Begins

The accompanying Engineering Blueprint defines enterprise AI architecture, model abstraction, context orchestration, prompt stewardship, enterprise memory integration, human approval workflows, governance, security boundaries, and Version 1 implementation requirements.
