

MASS-APP-014B

AI Generation Services

Executive Engineering Brief

Version 1.0

Purpose of this Volume

This volume engineers the enterprise services responsible for AI-assisted content generation. It establishes a governed framework for creating images, graphics, diagrams, documents, presentations, layouts, videos, and other creative assets while preserving enterprise quality, traceability, and brand consistency.

Engineering Philosophy

Generation is a service, not an authority. AI assists creative professionals by accelerating production, proposing alternatives, and reducing repetitive work while leaving strategic direction and final approval under human governance.

Construction Objectives

Version 1 establishes image generation, image editing, diagram generation, presentation drafting, document layout assistance, marketing asset generation, template-aware creation, prompt stewardship, generation history, revision tracking, asset versioning, and reusable generation workflows.

Relationship to MASS HQ

This volume extends the AI Foundation established in 014A and integrates with the Design Studio, Communications Center, Knowledge Center, Document Center, and Enterprise Analytics while consuming governed enterprise services rather than duplicating them.

Core Engineering Principles

Generated assets shall remain attributable, explainable, versioned, reviewable, reproducible where practical, and governed by enterprise brand standards. Every generated artifact shall preserve its relationship to prompts, source assets, and approval history.

Claude Engineering Guidance

Engineer AI generation as modular enterprise services with provider abstraction, configurable workflows, reusable prompt templates, and enterprise asset awareness. Human review and approval shall remain configurable for all production workflows.

Definition of Success

Organizations can safely generate professional enterprise assets with AI while maintaining governance, intellectual property stewardship, auditability, brand integrity, and enterprise trust.

Engineering Blueprint Begins

The accompanying Engineering Blueprint defines generation architecture, provider abstraction, prompt lifecycle, asset pipeline, revision services, approval workflows, storage integration, security boundaries, and Version 1 implementation requirements.
