

MASS-APP-014E

AI Governance & Creative Stewardship

Executive Engineering Brief

Version 1.0

Purpose of this Volume

This volume establishes the governance framework for Artificial Intelligence throughout MASS HQ. It defines the policies, controls, approval boundaries, audit expectations, provider governance, intellectual property stewardship, and lifecycle management required for responsible enterprise AI.

Engineering Philosophy

Enterprise AI must be trusted before it is relied upon. Governance exists to preserve transparency, accountability, security, privacy, explainability, and constitutional ownership while enabling innovation. Every AI capability shall operate within clearly defined enterprise boundaries.

Construction Objectives

Version 1 establishes model governance, provider abstraction, prompt stewardship, approval workflows, audit trails, content provenance, copyright and intellectual property stewardship, privacy controls, security boundaries, usage monitoring, cost governance, lifecycle management, and enterprise AI policy enforcement.

Relationship to MASS HQ

This volume governs every AI capability within the MASS ecosystem. It applies to Design Studio, Communications, CRM, Knowledge, Documents, Executive Intelligence, Operations, Analytics, and every future AI-enabled application while consuming existing Engineering services for identity, security, observability, persistence, and workflow.

Core Engineering Principles

AI shall remain constitutional, explainable, attributable, auditable, secure, privacy-aware, provider-independent, human-governed, and continuously reviewable. No AI capability shall bypass enterprise permissions or constitutional ownership boundaries.

Claude Engineering Guidance

Engineer governance as reusable enterprise services rather than application-specific logic. Every AI interaction shall support configurable approvals, complete auditability, model abstraction, policy enforcement, enterprise traceability, and future provider interchangeability.

Definition of Success

Organizations possess a comprehensive AI governance framework that enables safe enterprise adoption of artificial intelligence while protecting organizational knowledge, customer trust, regulatory obligations, and long-term maintainability.

Engineering Blueprint Begins

The accompanying Engineering Blueprint defines governance architecture, approval services, policy enforcement, prompt lifecycle, provider management, audit framework, security controls, privacy architecture, compliance model, and Version 1 implementation requirements.
