Operations Engineering Specification

Version 1.0

Engineering Objective

Operations implements the constitutional capability responsible for enterprise execution. It transforms enterprise strategy into consistent operational outcomes while preserving constitutional boundaries. Operations coordinates work; it does not own relationships, customer experience, communications, or finance.

Engineering Preface

Operations is the enterprise execution steward. It receives intelligence from Relationship Command, Customer Experience, and Growth, converting strategic intent into measurable execution. Every workflow shall improve consistency, accountability, efficiency, and enterprise learning. Operational excellence is achieved through disciplined stewardship, not command and control.

Purpose & Scope

Operations governs work execution, process orchestration, resource coordination, service standards, quality assurance, operational intelligence, and continuous improvement. Out of Scope: field scheduling (Dispatch), financial processing (Finance), relationship ownership (Relationship Command), communications delivery (Communications), and growth strategy (Growth).

Architecture

Core Components: Operations Service, Process Registry, Standard Operating Procedure Repository, Resource Coordination Service, Quality Service, Operational Intelligence Service, Performance Metrics Registry, Continuous Improvement Service, Capacity Service, Escalation Service.

Engineering Requirements

Functional: orchestrate enterprise work, enforce operational standards, monitor quality, coordinate resources, measure performance, identify bottlenecks, recommend improvements. Non-Functional: scalable, observable, auditable, resilient, secure, constitutionally compliant.

Dependencies & Responsibilities

Requires Enterprise Core, Identity, Security. Uses Workflow, Knowledge, Documents, AI, Notifications, Observability, Persistence, Error, Configuration, API, Integration, Relationship Command, Customer Experience, Growth. Provides Operational Intelligence, Resource Coordination, Performance Measurement, Continuous Improvement. Owns execution standards; does not own dispatch, finance, communications, marketing, or relationships.

Interfaces, Example Flow & Implementation

Interfaces: `InitiateOperation()`, `ExecuteWorkflow()`, `AllocateResources()`, `EvaluatePerformance()`, `RecordOperationalOutcome()`, `RecommendImprovement()`. Example Flow: Growth identifies opportunity -> Relationship Command identifies stakeholders -> Customer Experience defines journey -> Operations executes enterprise process -> Dispatch coordinates field execution -> Finance records value -> Communications informs stakeholders. Definition of Done: Operations consistently executes enterprise work while producing measurable operational intelligence and continuous improvement recommendations.
